Public Involvement Highlights

- Three corridor input team scoping meetings held
  - Denver (9/10)
  - I-70 (9/11)
  - I-25 (9/16)
- Scoping report in progress
- Community partnership program initiated
- Web site updates
Corridor Input Team Scoping Meetings

- Invitations broadly distributed via MPOs, TPRs and I-70 coalition

- Meetings summarized the study and gathered high-level input related to:
  - Vehicle technology categories
  - Alignments
  - Local activity centers (existing/planned)
  - Local future vision
  - Local concerns/issues

- Verbal comments gathered at meeting; Written comments still coming in
### Scoping Meeting Attendees

- Arvada
- Avon
- Breckenridge
- CDOT
- Central city
- Clear creek county
- Colorado springs
- Copper mountain
- Denver
- Dillon
- DRCOG
- Eagle county
- El Paso county
- Empire
- Evans
- Fort Carson
- Fort Collins
- Frederick
- Frisco
- Golden
- Grand county
- Grand junction
- Georgetown
- Jefferson county
- Lakewood
- Larkspur
- Lone tree
- Mesa county
- Mountain metro transit
- NFRMPO
- NWTPR
- PPACG
- Routt county
- SCCOG
- Silverthorne
- Silver Plume
- Steamboat Springs
- Summit County
- Summit Stage
- Timnath
- Trinidad
- Wheat Ridge
- Yampa

*Individual consultation w/ RTD, DIA and other entities*
Key Technology Considerations

- **Physical/Performance**
  - Maximum grade, speed and tilt capabilities
  - Acceleration and braking
  - Operational reliability and in-service history

- **General**
  - Weight, size, seating capacity
  - Light freight and baggage capabilities
  - Emergency evacuation safety procedures

- **Economic**
  - Staffing (train crew size & duties, station staff size & roles)
  - Operating, maintenance and capital costs
  - Regulatory approvals
# Vehicle Technology Categories

<table>
<thead>
<tr>
<th>Type</th>
<th>Power Source</th>
<th>Maximum Operating Speeds*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conventional Rail</td>
<td>Electric or Diesel</td>
<td>79 mph</td>
</tr>
<tr>
<td>High-Speed Rail</td>
<td>Electric or Diesel</td>
<td>110 – 130 mph</td>
</tr>
<tr>
<td>Very High-Speed Rail</td>
<td>Electric</td>
<td>150 – 220 mph</td>
</tr>
<tr>
<td>Ultra High-Speed</td>
<td>Electric</td>
<td>250 – 300 mph</td>
</tr>
</tbody>
</table>

* Actual operating speeds would vary depending on community sensitivities, topography and other factors. Particularly in densely populated and other sensitive areas, actual operating speeds would be much lower than these speeds.
Scoping Input Thus Far

Technology

- General support for the categories of technologies to be evaluated
- User/system interoperability is of greater importance than technology interoperability
  - Benefits of technology interoperability were identified
- “Proven technology” was an important evaluation criteria
- Support for evaluating conventional rail technologies
Key Alignment Considerations

- **I-70 Corridor**
  - Grades and curves (speed vs. cost)
  - Do not assume I-70 reconstruction
  - Environmental sensitivities
  - Local plans/needs/desires

- **I-25 Corridor**
  - Constraints on existing rail alignment (pending Rail Relocation Study)
  - New “greenway” alignment not dependent on freight rail relocation but very costly
  - Local plans/needs/desires

- **Denver Metro Area**
  - Connection and coordination with DIA and FasTracks
  - Local plans/needs/desires
  - Distinction between local and intercity service
General Alignment Options
**Scoping Input Thus Far**

**Alignments / Stations**

- General understanding and agreement of general corridors and secondary corridors to be evaluated
- Explicit desire to not limit alignment options to highway routes
- Some concern with conflict between intercity station spacing and desires for more local access/service
- Desire for a transparent station-selection process (I-25 corridor)
- Concern over ROW sharing among the options between possible future commuter rail and high-speed rail alignments (N. I-25 corridor)
Study Comments / Questions

- Strong support for the market-driven approach, particularly related to stations
- Interest in coordination between our stated preference survey and front range MPOs’ “front range survey”
- Desire to see greater participation from more key entities in northern Colorado
Scoping Input: Next Steps

- Compile and review all input from comment forms (responses still coming in)
- Develop and submit Scoping Report to RMRA
  - Scoping process overview
  - Summary of scoping input
- Use report to help inform Alternatives Workshop
Community Partnership Program

- Study team list has been enhanced by some RMRA members
  - Not to late to submit recommendations

- Materials developed and pending approval:
  - Introduction letter
  - Stock newsletter/web article
  - Study fact sheet
  - Study map
A Look Ahead...

**October**
- Finalize Scoping Report
- Outreach to Community Partnership Program
- Schedule and announce Corridor Input Team Alternatives Development meetings (1st week of December)

**November**
- Review/revise project materials based on 10/30 Alternatives Development Workshop
- Media outreach surrounding alternatives development

**December**
- Corridor Input Meetings (Alternatives Development)
- Outreach to Community Partnership Program
Technology Existing Conditions
Representative Equipment Options

Conventional 79 mph
- Conventional Amtrak

High Speed 110-130 mph
- Talgo T21

Very High Speed 150-220 mph
- Siemens ICE

Ultra High Speed 250-300 mph
- Transrapid Maglev
Incremental Rail: Hill Climbing Capability*

* On Straight-and-Level Track versus 4% Uphill Grade
This shows the clear superiority of electric technology for severe gradient applications
FRA Equipment Regulations

- **Basic safety rules for window glazing, interior lighting, baggage handling, etc.**
  - Applies to all equipment types including maglev.

- **Tier I and tier II crashworthiness standards.**
  - For equipment that is operated on the US national rail system.
  - Buff strength requirement for passenger cars of 800,000# is the **same** for both tier I and tier II passenger cars.
  - Tier II locomotives need 2,100,000# buff strength.
  - Tier II equipment must be designed for “crash energy management.”
  - Leading unit may not be occupied by passengers in tier II equipment.
Locomotive Hauled Vs Self Propelled

- **Locomotive-Hauled**
  - *1st Generation ICE Train: Loco-Hauled*
    - The locomotive provides a buffer to the passenger compartment in case of a collision – In the US, passenger seating is prohibited in the leading unit of a Tier II passenger train.

- **Self-Propelled**
  - *3rd Generation ICE Train: EMU*
    - Every axle can be powered for more total power, but only 50% were needed in Germany
    - Greater operating efficiency and flexibility
    - FRA Regulations prohibit occupied 1st Car above 125-mph
Rail Adhesion Factors

1st Generation ICE Train: Loco-Hauled
- Weight of two locomotives: 187 tons
- Total train 2,174,000 pounds for 645 seats
- Assume $\mu = 15\%$ (A safe assumption for wet rails)
- Tractive Effort Capability = $187 \times 2000 \times 15\% = 56,100$ pounds
- Maximum Grade = $56,100 / 2,174,000 = 2.6\%$

3rd Generation ICE Train: EMU
- Train Weight: 1,000,000 pounds for 404 seats
- 50% of axles powered
- Assume $\mu = 15\%$
- Tractive Effort Capability = $500 \times 2000 \times 50\% \times 15\% = 75,000$ pounds
  (could be 150,000 pounds if all axles were powered)
- Maximum Grade = $75,000 / 1,000,000 = 7.5\%$
  (could make 15\% if all axles were powered)

$H = \mu V$

$H = \text{Horizontal Component, Tractive Effort}$

$\mu = \text{Coefficient of Adhesion}$

$V = \text{Vertical Component, Vehicle Weight}$
Representative Rail Equipment

- **American Trains**
  - **Diesel Power**
    - Coaches powered by Boise Locomotive rebuilt diesel
    - Coaches powered by General Electric P-40
    - Colorado Railcar DMU
  - **Electric Power**
    - Acela High Speed Train
    - Conventional Train powered by HHP-4 Electric Locomotive

- **European and Japanese Trains**
  - **Diesel Power**
    - British HST 125
    - German VT605 (ICE-TD DMU)
    - Spanish Talgo Diesel
  - **Electric Power**
    - Italian Pendolino
    - British ICE-225
    - French TGV Duplex
    - German ICE-3
    - Spanish Talgo Electric
    - Swedish X2000
    - Shinkansen N700
Maglev Review

• LSM Motor (Guideway Based)

German Transrapid
• Speeds of up to 300-mph proven in daily operation
• In operation at test track and Shanghai airport line
• Very expensive guideway
• It will be difficult to achieve the geometric standards required by this guideway on the I-70 corridor. It may be achievable on I-25.

• LIM Motor (Vehicle Based)

Japanese HSST
• This type of system was suggested by the 2004 Colorado Maglev study
• Speeds of up to 60-mph proven in daily operation – but speeds of 100-mph are unproven and require system enhancement
• LIM guideway more economical than LSM
• In operation at test track and Nagoya’s Tobu Kyuryo line
• American Maglev has similar technology but no revenue implementation experience
Novel Technologies

Data Collection is Under Way...

Air Train Global

Labis Train
Fall Survey Status
Survey Goal

- Quantify how much travelers value time and frequency
- Discriminate behavior by mode and purpose of travel
- Evaluate O/D flows

This will be achieved using a **quota survey**.
## Proposed Survey Locations

Station Spacing Guidelines
Station Spacing Guidelines

Local Bus
- Service Area: Urban and suburban uses, ½ to 5 miles
- Typical Speeds: 10 mph
- Station Spacing: 2 to 4 blocks

Streetcar
- Service Area: Urban and suburban streets, ½ to 6 miles
- Typical Speeds: 10 mph
- Station Spacing: 2 to 4 blocks

Personal Rapid Transit
- Service Area: Small area networks or campuses, 1 to 5 miles
- Typical Speeds: 15 mph
- Station Spacing: ¼ to 1 mile

Source: DMJM + Harris/CTE Engineers
Station Spacing Guidelines

Light Rail
• Service Area: Urban or suburban uses, 1 to 10 miles or more
• Typical Speeds: 15 to 25 mph
• Station Spacing: ¼ to 1 mile

Bus Rapid Transit
• Service Area: Urban and suburban uses, 1 to 10 miles or more
• Typical Speeds: 15 to 25 mph
• Station Spacing: ¼ to 1 mile

Heavy Rail
• Service Area: Urban uses and loadings, 1 to 10 miles or more
• Typical Speeds: 25 to 40 mph
• Station Spacing: ¼ mile downtown, up to 2 miles in neighborhoods

Source: DMJM + Harris/CTE Engineers
Station Spacing Guidelines

Automated Guideway/Monorail
- Service Area: airports, theme parks, circulators, ½ to 5 miles
- Typical Speeds: 15 to 30 mph
- Station Spacing: 1/2 to 2 miles

Commuter Bus
- Service Area: Suburbs to city, 15 to 100 miles
- Typical Speeds: 30 to 50 mph
- Station Spacing: 3 to 7 miles, or at end points

Commuter Rail
- Service Area: Suburbs to city, 15 to 100 miles
- Typical Speeds: 30 to 50 mph
- Station Spacing: 3 to 7 miles

Source: DMJM + Harris/CTE Engineers
Station Spacing Guidelines

High Speed Rail
- Service Area: Intercity, 150 to 300 miles
- Typical Speeds: 110 to 186 mph
- Station Spacing: 20 to 50 miles

Maglev
- Service Area: Intercity, 100 to 300 miles
- Typical Speeds: 250 to 340 mph
- Station Spacing: 20 to 50 miles

Source: DMJM + Harris/CTE Engineers
Increased Speed Means Greater Station Spacing

Local Bus (10mph) 2-4 blocks
Commuter Rail (30-50mph) 3-7 miles
Intermediate Rail (90-120mph) 10-30 miles
High Speed Rail (120-200mph) 20-50 miles
Maglev (250mph) 20-100 miles

RMRA Study Range
Demand Validation Process
Demand Model Validation

1. Total Demand – Compare with historic trends by mode.

2. Elasticity Analysis – Comparison with known elasticities (e.g., other corridors that have been developed or are in development).

3. Benchmark Analysis – Comparison with total demand, induced demand, and modal split for other corridors. (e.g., Boston-Portland, Northeast Corridor).
Thank You.
